

CLAIMS

I claim:

1. A simplified hinging device and temple bar thereby obtained, particularly for eyeglass frames, characterized in that it comprises a preferably metallic termination, U shaped and holed so as to obtain a female hinge which engages by means of a screw, a pivot pin or one or more projections, another preferably metallic termination, shaped and holed so as to obtain a male hinge.

2. A simplified hinging device and temple bar thereby obtained, particularly for eyeglass frames, as claimed in claim 1, characterized in that an end of a termination is widened, shaped and holed and subsequently bent into a U shape, so as to form a female hinge.

3. A simplified hinging device and temple bar thereby obtained, particularly for eyeglass frames, as claimed in claims 1 and 2, characterized in that the U bent termination has a projection as a union of the two half-hinges and as end stop.

4. A simplified hinging device and temple bar thereby obtained, particularly for eyeglass frames, as claimed in claims 1, 2 and 3, characterized in that another termination is widened, shaped and holed, to form a male hinge.

5. A simplified hinging device and temple bar thereby obtained, particularly for eyeglass frames, as claimed in the previous claims, characterized in that the termination which forms the male hinge has a throat which engages the end stop projection of the female hinge.

6. A simplified hinging device and temple bar thereby obtained, particularly for eyeglass frames, as claimed in the previous claims, characterized in that the terminations are associated and free to rotate about a screw, pivot pin or projection.
